Prepared By: Zachary Clark

Other : **PBC:** Kerl LaJeune, Director of Planning & Design, Justin Cafferty, DM , Brandon McNair , PM,
BED: Pam Crowell , PA, Ellen Dickson PIC

Items Discussed:
1. Discussed plumbing shortfall for a new addition to an existing college.
   a. BED reached out to determine the procedures when there is a shortfall of plumbing fixtures as part of a new addition. BED described that they are working on a project which includes the addition of an assembly hall to an existing college. BED noted that there are 6 new plumbing fixtures that are part of the new addition, and existing plumbing fixtures within then existing facility. BED has performed the occupancy calculations for the entire facility, both existing and new, as well as fixture calculations and there is a shortfall of 1 Female WC, 1 Male Lav and (2) Female Lavs. BED asked what the procedure is when there is a shortfall.
   b. (MW) asked if there is a bathroom facility within 200' of the addition? BED responded yes.
   c. (MW) asked if the new fixtures are ADA compliant? BED stated yes.
   d. (MW) asked if there are additional ADA compliant bathrooms within 200' of the existing? BED stated yes.
   e. (MW) asked if the project was going to be submitted for standard plan review? BED stated yes.
   f. (MW) stated the plumbing reviewer would not request additional fixtures if the shortfalls are only a few fixtures as stated. When BED submits for permit, they should provide the occupancy and plumbing calculations indicating where on the plans the new and existing toilet facilities are located. If the fixture shortfalls are accurately documented, the project should receive approval with the shortfalls, pending permit review and any further

3. THE CONTRACTOR SHALL PROVIDE EROSION CONTROL AS INDICATED ON THE PLANS AND REQUIRED BY THE OWNER.
4. THE CONTRACTOR SHALL KEEP THE STREETS CLEAN OF DEBRIS AND PROVIDE SWEEPING OF THE STREET AS REQUIRED BY THE OWNER.
5. SOIL DISTURBANCE SHALL BE CONDUCTED IN SUCH A MANNER AS TO MINIMIZE EROSION. SOIL STABILIZATION MEASURES SHALL CONSIDER THE TIME OF YEAR, SITE CONDITIONS AND THE USE OF TEMPORARY OR PERMANENT MEASURES.
6. SOIL EROSION AND SEDIMENT CONTROL FEATURES SHALL BE CONSTRUCTED PRIOR TO THE COMMENCEMENT OF HYDROLOGIC DISTURBANCE OF UPLAND AREAS.
7. DISTURBED AREAS SHALL BE STABILIZED WITH TEMPORARY OR PERMANENT MEASURES WITHIN 7 CALENDAR DAYS OF THE END OF ACTIVE HYDROLOGIC DISTURBANCE, OR RE-DISTURBANCE.
8. STOCKPILES OF SOIL OR OTHER BUILDING MATERIALS TO REMAIN IN PLACE MORE THAN 3 DAYS SHALL BE FURNISHED WITH EROSION AND SEDIMENT CONTROL MEASURES (i.e. PERIMETER SILT FENCE). STOCKPILES TO REMAIN IN PLACE MORE THAN 14 DAYS OR MORE SHALL RECEIVE TEMPORARY STABILIZATION WITHIN 7 DAYS.
9. ALL STORM SEWERS THAT ARE OR WILL BE FUNCTIONING DURING CONSTRUCTION SHALL BE PROTECTED, BY AN APPROPRIATE SEDIMENT CONTROL MEASURE.
10. ALL TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES SHALL BE REMOVED WITHIN 30 DAYS AFTER FINAL SITE STABILIZATION IS ACHIEVED OR AFTER THE TEMPORARY MEASURES ARE NO LONGER NEEDED.
11. ALL TEMPORARY AND PERMANENT EROSION CONTROL MEASURES MUST BE MAINTAINED AND REPAIRED AS NEEDED.

A STABILIZED MAT OF AGGREGATE UNDERLAIN WITH FILTER CLOTH (OR OTHER APPROPRIATE MEASURE) SHALL BE LOCATED AT ANY POINT WHERE TRAFFIC WILL BE ENTERING OR LEAVING A CONSTRUCTION SITE TO OR FROM A PUBLIC RIGHT-OF-WAY, STREET, OR PARKING AREA. ANY SEDIMENT OR SOIL REACHING AN IMPROVED PUBLIC RIGHT-OF-WAY, STREET, OR PARKING AREA SHALL BE REMOVED BY SCRAPING OR STREET CLEANING AS ACCUMULATIONS WARRANT AND TRANSPORTED TO A CONTROLLED SEDIMENT DISPOSAL AREA.
13. IF DEWATERING SERVICES ARE USED, ADJOINING PROPERTIES AND DISCHARGE LOCATIONS SHALL BE PROTECTED FROM EROSION. DISCHARGES SHALL BE ROUTED THROUGH AN EFFECTIVE SEDIMENT CONTROL MEASURE (e.g. SEDIMENT TRAP, SEDIMENT BASIN, OR OTHER APPROPRIATE MEASURE.
14. THE EROSION CONTROL MEASURES INDICATED ON THE PLANS ARE THE MINIMUM REQUIREMENTS. ADDITIONAL MEASURES MAY BE REQUIRED, AS DIRECTED BY THE ENGINEER OR GOVERNING AGENCY.
15. CONTRACTOR SHALL UTILIZE APPROPRIATE SOIL EROSION MEASURES, SUCH AS WATERING TECHNIQUES TO CONTROL DUST POLLUTION LEAVING THE SITE. DUST CONTROL SHALL BE PROVIDED IN ACCORDANCE WITH SECTION 825 OF THE ILLINOIS URBAN MANUAL.
16. THE CONTRACTOR SHALL PROVIDED CONCRETE WASHOUT FACILITIES, AT A CONVENIENT LOCATION DURING ALL CONCRETE CONSTRUCTION ACTIVITIES.
17. PRIOR TO COMMENCING LAND-DISTURBING ACTIVITIES IN AREAS OTHER THAN INDICATED ON THESE PLANS (INCLUDING BUT NOT LIMITED TO, ADDITIONAL PHASES DEVELOPMENT AND OFF-SITE BORROW OR WASTE AREAS) A SUPPLEMENTARY EROSION CONTROL PLAN SHALL BE SUBMITTED TO THE OWNER FOR REVIEW.
18. GRAVELED ROADS, ACCESS DRIVES, PARKING AREAS OF SUFFICIENT WIDTH AND LENGTH, AND VEHICLES WASHDOWN FACILITIES, SHALL BE PROVIDED TO PREVENT THE DEPOSIT OF SOIL FROM BEING TRACKED ONTO PUBLIC OR PRIVATE ROADWAYS. ANY SOIL REACHING A PUBLIC OR PRIVATE ROADWAY SHALL BE REMOVED PROPERLY AT THE END OF EACH WORKING DAY.

INSPECTION SCHEDULE

This drawing is schematic in nature. Final routing of piping & wiring shall be determined by the installing contractor and/or designer of record.

Additional refrigerant charge is needed depending on the size and length of extended piping. Please refer the amount of pre-charge and the formula of calculation which is mentioned on the data book.

1.25mm(16 AWG) : 1.25mm(16 AWG) or more.

0.75mm(20 AWG) : between 0.5mm(24 AWG) and 0.75mm(20 AWG).

Coded Notes:

NOTE 1: Install twinning Y's within 15 degrees of level and with 20 inches of straight pipe on converging connection - reference installation manual for additional details including but not limited to special trapping requirements when twinning, and pipe slope requirements

Building Automation System Interface:
The Building Automation System (BAS) shall send the controller Occupied Bypass, Morning Warm-up, Pre-Cool, Occupied / Unoccupied and Heat / Cool modes. If communication is lost with the BAS the controller, the unit shall operate using default modes and setpoints. The BAS shall also send the controller a duct static pressure setpoint, discharge air temperature setpoint, relative humidity (RH) setpoint, and damper minimum position.

Sequence of Operation—"Occupied"
Emergency Stop.
When the emergency contacts are open, the unit's operation will be in Alarm Status. The Alarm has to be reset from either the BAS or the display in the unit.

Starting Sequence
The unit is placed in occupied operation by the BAS. Occupancy sensors shall be associated with the VAV boxes serving the spaces. Upon any occupancy sensor activation, the BAS shall enable the DOAS system. Spaces shall be able to be scheduled and forced into occupancy for a predetermined interval of time via the BAS for prescheduled events.

The outdoor air and return air dampers will be commanded to move to their preset occupied positions. The fan shall be enabled and the indoor fan run speed based on the duct static pressure. If after 30 seconds the indoor fan proving switch does not prove the indoor fan on, the main unit controller will command the indoor fan off and signal an alarm.
Minimum fan speeds are determined from the heater manufacturer's requirements or the requirements for the indoor coil. Maximum fan speeds are determined by the indoor coil requirements or job specific max airflow.

Occupied Operating Modes
A. Heating
B. Cooling

All modes are enabled by the main unit control module. The control module calculates dewpoint based on sensed outdoor air temperature and humidity.

A. Heating Mode.
Should the Outdoor Air Temperature fall below the Discharge Air Temperature Setpoint 68°F, plus the Heat/Cool Mode Deadband (field adjustable; factory default of 4°F), then Heating Mode shall be enabled.

During Heating Mode the main unit controller will modulate the heating output to maintain the Discharge Air Temperature Setpoint. Maximum discharge air heating temperature shall be adjustable but shall not be allowed to exceed 90°F. Hot gas reheat is disabled when heating is enabled.

Morning Warmup
Prior to morning scheduled occupancy, if ambient temperature is lower than 45F (adj), the unit shall enter morning warmup. During Morning Warmup the OA damper shall be closed, the fan shall be commanded to full speed, the unit will modulate the discharge air temperature to maintain 100 degrees, and all zone dampers shall be commanded open. The BAS shall use intelligent adaptive recovery and record prior days' warmup period.

B. Cooling Mode
Should the Outdoor Air Temperature rise above the off cooling coil leaving Air Temperature Setpoint (55°F), then Cooling Mode shall be enabled. Hot gas reheat (HGRH) shall modulate to maintain the unit leaving air temperature of 60F (adj) in cooling mode.
Compressor control is based on cooling coil leaving Air Temperature Setpoint. The DX cooling shall modulate to maintain off coil temperature setpoint of 55F (adj). Modulating hot gas reheat will be used to temper the discharge air, if necessary, to elevate LAT to 60F (adj).

Occupied Dehumidification:
Zone temperature and humidity (%RH) shall be continually monitored and actively controlled. Dehumidification mode shall be enabled when the unit is not in Heating Mode or and all space temperatures are below 74F (adj) and an individual zone Space RH rises above the Space RH Setpoint of 50% RH (adj). Dehumidification shall remain active until all zones are below 50% RH, or if heating mode is enabled.

The compressors shall maintain an Evaporator Leaving Temperature Setpoint of 55F (adj). HGRH shall modulate to maintain the leaving unit discharge air setpoint of 70F (adj).

Occupied Hot Gas Reheat:
During the dehumidification cycle, the Hot Gas Reheat shall be enabled and shall modulate to maintain the discharge air setpoint. The hot gas reheat coil will undergo a purge cycle every 30 minutes for 3 minutes. During the purge cycle the, hot gas reheat coil is bypassed 100%. The Heating cycle is disabled when the hot gas reheat cycle is enabled.

Occupied Hot Gas Reheat Purge
Following continuous 30-minute hot gas reheat operation at less than 100 percent reheat capacity a purge cycle will be initiated. During the purge cycle, the hot gas reheat signal is set and held at 100 percent for a period of 3 minutes. Following the purge cycle, normal operation resumes.

Exhaust Fan Operation
When the indoor fan operation has been proven and the unit is in occupied there will be a call for the exhaust. When there is a call for the exhaust the isolation dampers will be powered and the powered exhaust will be enabled once the end switch on the exhaust damper actuators are proven. If the unit is equipped with modulating dampers, the exhaust fan speed will modulate to maintain the Return Duct/Space Pressure Setpoint (factory defaulted to 1" WC). If modulating dampers are not equipped, the exhaust will maintain a constant volume of airflow.
During Unoccupied the powered exhaust will be shut off.

Energy Wheel Operation
The Energy Recovery Ventilator (ERV) is interlocked with indoor fan and exhaust fan operation in occupied heating, dehumidification or cooling modes. When operating in Economizer Mode the ERV is disabled and the ERV by-pass dampers will open, powered exhaust remains on. If Economizer Mode has been enabled for 10 minutes the ERV will be enabled for one minute. This cycle will repeat every 10 minutes.
During ERV operation, if the Exhaust Temperature across the ERV drops below 25°F, the outdoor air bypass damper will start to slowly modulate open. If after the bypass dampers modulate to 100 percent open and the exhaust temp across the ERV drops below 15°F (2°F Deadband) for 5 minutes, the unit controller will command the ERV off.
During part load conditions, when the full heat recovery of the ERV is oversized, variable effectiveness is required. The bypass damper on the outdoor side will modulate open to reduce the temperature leaving the wheel to prevent overshooting setpoint.
During Unoccupied both the ERV and the powered exhaust will be shut off.

Demand Control CO2 Ventilation
Space CO2 shall be continuously monitored by the BAS and the DOAS system shall modulate to maintain space CO2 level concentrations. If the CO2 level in the space is higher than the setpoint, the zone level VAV dampers shall modulate open until the CO2 levels in the space are within the setpoint value. Once setpoint is met, the zone dampers will then slowly begin to modulate closed until space CO2 level to change.

Airflow Monitoring
Both the SF and EF airflow shall be monitored via piezo ring and displayed at the BAS.

Sequence of Operation—"Unoccupied"
Emergency Stop.
When the emergency contacts are open, the unit's operation will be in Alarm Status. The Alarm has to be reset from either the BAS or the display in the unit.

Starting Sequence
Indoor fan proving sequence is identical to occupied operation.

Starting Sequence with Optional Return Air Damper Installed
The outdoor air damper will be commanded to close and the return air damper will open. Outdoor air damper end switch is disabled when the return air damper is installed. Supply fan shall start and modulate to maintain the Duct Static Pressure Setpoint, the exhaust fan and energy wheel shall remain off, and the outside air damper shall remain closed.

Starting Sequence with No Return Air Damper Installed
Identical to occupied sequence no return air damper installed but the outdoor damper will remain open.

Operating Modes
A. Cooling
B. Heating

A. Unoccupied Cooling Mode.
In order for unoccupied cooling to be enabled, a true value must be written to UNOCC Cooling Mode. The unit shall stage the compressors to maintain the Discharge Air Temperature Setpoint. Unoccupied Cooling Mode will continue until a false value is written to the UNOCC Cooling Mode.

B. Unoccupied Heating Mode.
In order for unoccupied heating to be enabled, a true value must be written to UNOCC Heating Mode. The unit shall stage the heat to maintain the Discharge Air Temperature Setpoint. Unoccupied Heating Mode will continue until a false value is written to the UNOCC Heating Mode.

RTU SEQUENCE OF OPERATIONS:

1.1 AIR HANDLING UNIT CONTROL

A. General: The air handling systems is a variable air volume system serving terminal units throughout the building.

B. Start/Stop Control:
   1. Provide optimal start/stop scheduling.
   2. During occupied mode, the air handling system shall operate continuously.
   3. During unoccupied mode, the air handling system shall operate as described below.
   4. The system shall start during near the end of the unoccupied period in warm-up/cool-down mode. The start time shall vary such that all spaces are at their occupied temperatures at the beginning of the occupied period.

C. Provide individual control of outside air damper, return air damper and exhaust air damper. Control in unison to provide economizer system of damper control.

D. Supply Fan Control
   1. Supply fan variable speed drive(s) will modulate based on static pressure tip located 2/3 down the supply main duct. The initial static setpoint will 1" WC (adj.).
   2. The BAS shall monitor the position of the damper of all VAV terminal units connected to the air handling unit. The static pressure setpoint shall be reset every 10 minutes in 0.05" WC increments. If none of the dampers are commanded to 80% or more open for 10 minutes, reduce the static pressure setpoint. If one or two dampers are commanded to 95% open or more, maintain the static pressure setpoint. If three or more dampers are commanded to 95% open or more, increase the static pressure setpoint. The minimum static pressure setpoint shall be 0.10" WC (adj.).
   3. When multiple supply fans operate, all shall operate at the same speed.

E. Return Fan Control:
   1. Return fan will modulate to maintain building static pressure setpoint.
   2. When multiple fans operate, all shall operate at the same speed.

F. Outside Air Damper Control:
   1. When the outside air enthalpy is greater than or equal to the return air enthalpy the outside air damper shall be positioned to the minimum outside air position.
   2. When the outside air enthalpy is less than the return air enthalpy, the outside air damper shall modulate open in sequence with the return air damper and relief dampers to satisfy the calculated discharge air requirements.

G. Discharge Air Temperature Control:
   1. The discharge air temperature set point shall initially be 55 degrees (adj.). The BAS shall monitor the position of the reheat coil demand of all VAV terminal units connected to the air handling unit.
   2. The discharge air temperature set point shall be reset every 10 minutes in 0.5 degree increments. If all reheat coil coils are commanded to 20% or more capacity for 10 minutes, increase the discharge air temperature setpoint. If one or two coils are commanded to less than 20%, maintain the discharge air setpoint. If three or more coils are commanded to less than 20% open, decrease the discharge air temperature setpoint.
   3. The discharge air temperature control loop shall modulate, in sequence, the gas furnace, OA/RA/EA dampers, and cooling coil.

H. Warmup mode: When occupied mode starts, if the return air temperature is less than 68 degrees, the discharge air temperature will be reset to 70 degrees until the return air temperature reaches 70 degrees.

I. Heating Coil Control:
   1. The preheat control loop will modulate the gas fired furnace to deliver the required discharge air temperature.
   2. The outdoor air damper must be driven to its minimum position before this control loop is allowed to function. During unoccupied times the control loop shall operate to maintain a mixed air temperature of 45 degrees.

J. Cooling Coil Control:
   1. The cooling coil control loop will modulate the refrigerant to deliver the required discharge air temperature.
   2. A dehumidification strategy shall be put in place to control the return air relative humidity levels. If the relative humidity of the return air exceeds 60% R.H.(adj.) the discharge air setpoint will be reset to its initial set point until the return air humidity falls below 55 % R.H. (adj.)

K. Unoccupied Mode:
   1. The system shall be in unoccupied mode only if all spaces are in unoccupied mode; otherwise the system shall be in occupied mode.
   2. The air handler shall be commanded to run during unoccupied times if any of the areas served have zone temperatures less than 65 degrees or greater than 78 degrees.
   3. When the outside air temperature is less than 65 degrees, the unit shall remain on until all zone temperatures are 67 degrees or higher.
   4. When the outside air temperature is greater than 70 degrees, the unit shall remain on until all zone temperatures are 76 degrees or lower.
   5. When the outside air temperature is between 65 degrees and 70 degrees, the unit shall be off.
   6. When the unit operates during unoccupied times, the outside air damper shall be closed and the humidifier shall be off.

L. Alarms and Notifications:
   1. All VFD drives shall be monitored and provide a fault condition to the BAS system.
   2. All fan banks are to have a separate VFD drive for each fan,
   3. Smoke detectors in the return ductwork shall shutdown the air handler via a supervisory signal from the Fire Alarm Control System if in an alarm condition.
   4. All smoke dampers are to be monitored by the Fire Alarm Control System and shutdown the air handler via a supervisory signal from the Fire Alarm Control System if any close.
   5. Low limit thermostat(s) installed at discharge of unit to shutdown the air handler if any temperature drops below 38 degrees.
   6. A supply high limit static pressure switch located in the main supply ductwork will shutdown the air handler anytime the pressure exceeds +3.5" (adj.).
   7. A return low limit static pressure switch located in the main return ductwork will shutdown the air handler anytime the pressure exceeds -2.0" (adj.)
   8. All safeties: fire alarm, smoke dampers, low limit (freeze), high static and low static shall alarm through the BAS system. Where multiple low limit thermostats are provided, provide a common alarm to the BAS system for all low limit thermostat(s).
   9. Filters shall be monitored and generate an alarm through the BAS system anytime the static pressure exceeds its adjustable setpoint.
